

## Creating Libraries

[Previous](#) [Top](#) [Next](#)

In order to create your own libraries, the following steps must be followed:

Create a header .h file with the prototypes of the library functions.  
Select the **File|New** menu command or press the  toolbar button.  
The following dialog window will open:

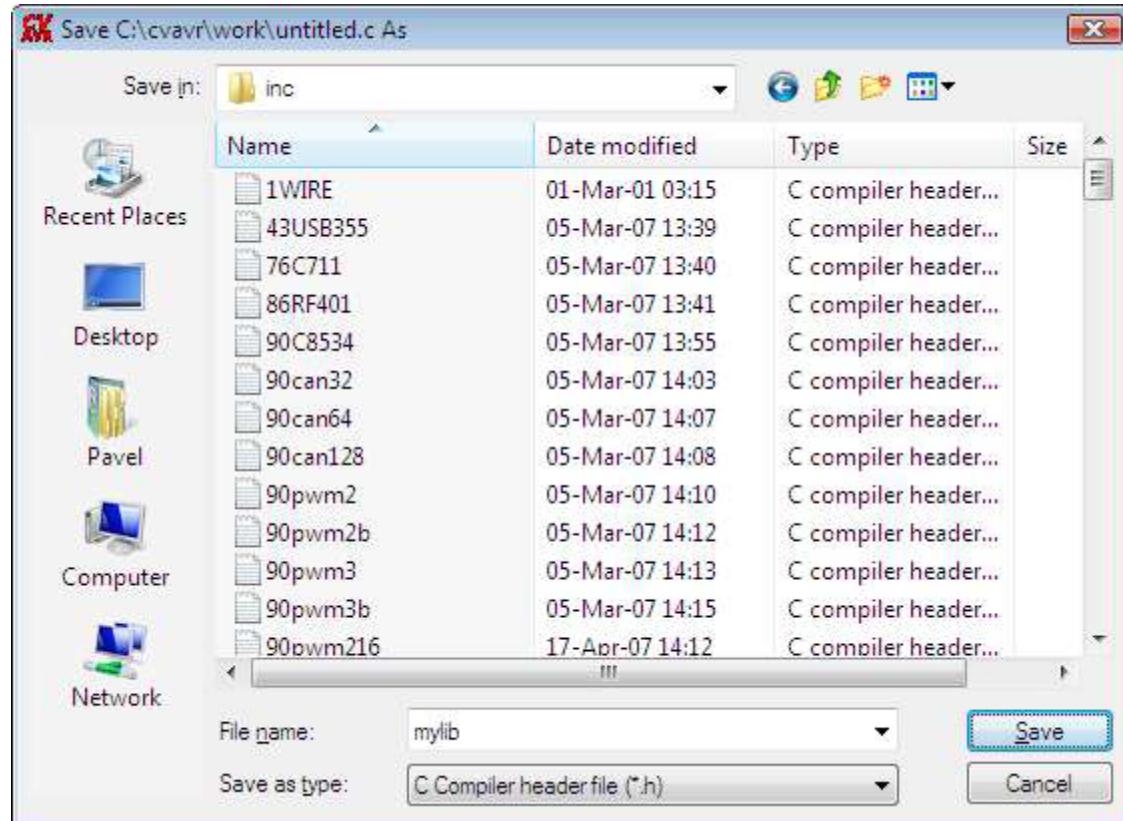

Select **Source** and press the **OK** button.

A new editor window will be opened for the **untitled.c** source file.

Type in the prototype for your function. Example:

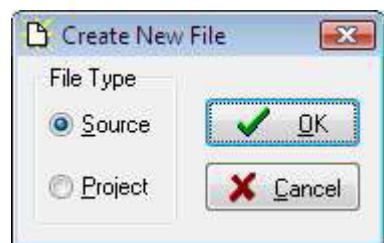

```
/* this #pragma directive will prevent the compiler from generating a
   warning that the function was declared, but not used in the program */
#pragma used+
/* library function prototypes */
int sum(int a, int b);
int mul(int a, int b);
#pragma used-
/* this #pragma directive will tell the compiler to compile/link the
   functions from the mylib.lib library */
#pragma library mylib.lib
```

Save the file, under a new name, in the **\INC** directory using the **File|Save As** menu command, for example **mylib.h** :

## 2. Create the library file.

Select the **File|New** menu command or press the **New** toolbar button.  
The following dialog window will open:

Select **Source** and press the **OK** button.

A new editor window will be opened for the **untitled.c** source file.

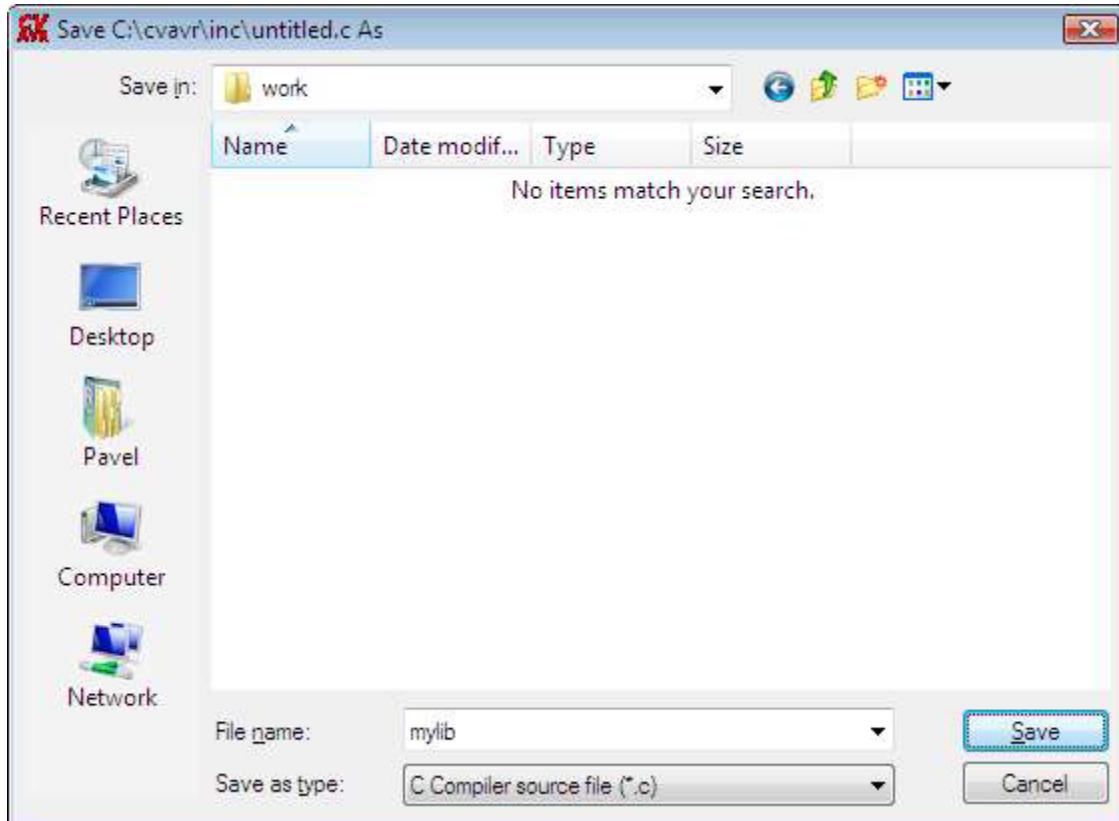

Type in the definitions for your functions.

Example:

```
int sum(int a, int b) {  
    return a+b;  
}
```

```
int mul(int a, int b) {  
    return a*b;  
}
```

Save the file, under a new name, for example **mylib.c**, in any directory using the **File|Save As** menu command:

Finally use the **File|Convert to Library** menu command or the  toolbar button, to save the currently opened .c file under the name **mylib.lib** in the .\LIB directory:

In order to use the newly created **mylib.lib** library, just **#include** the **mylib.h** header file in the beginning of your program.

Example:

```
#include <mylib.h>
```

Library files usually reside in the .\LIB directory, but paths to additional directories can be added in the [Project|Configure|C Compiler|Paths|Library paths](#) menu.
